Let's Start!

There are different sections when setting an ASP.NET page.

```
using asp.net;  
using System.Web;  
using System.Web.UI;  
using System.Web.UI.WebControls;  
public partial class SamplePage :  
html>  
<head id="Head1" runat="server">  
  <title>Single-File Page Model</title>  
</head>  
<body>  
  <form id="form1" runat="server">
```

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts. Describe applications for an operating system for personal computers in a range of work contexts.

Can Do Statements:

- I can give precise information about controls in pages in ASP.NET.
- I can list the core sections in ASP.NET.
- I can talk about characteristics of core sections in ASP.NET.

Ask your partner:

- What processes are involved in the creation of a website or web application?
- What types of sections do you think are required in the development of a web site or application?

Let's Explore!

It's time for an ASP.NET test!

Instructions: Read the text below.

- Martha:** Before starting the exam, we will revise some definitions. So, do you have any questions?
- Freddy:** I have one! Are ASP.NET pages made up of only controls?
- Martha:** Sort of. To be more precise I can tell you that controls in ASP.NET pages are essential. A page has different types; for example, HTML and Web server controls, validation controls, and user controls.
- Gloria:** Are these controls run by inheritance?
- Martha:** Yes, they are. As all ASP.NET elements, controls are objects that usually inherit functions from a parental control class.
- Freddy:** I have another question. Is an ASP.NET page divided into sections?
- Martha:** Indeed! ASP.NET pages are modular. I'll show you how to recognize the core sections in the following code snippet. Here we have: first, the Page Directives, the Code Section, and finally the Page Layout. Each one of those sections is supposed to show you what to use as an attribute.
- Freddy:** But, are those attributes established independently for each core section?
- Gloria:** I think so. For example, page directives are the ones that create an environment for making a page run. These directives are in charge of determining how to process pages. This is done through different page-specific attributes that allow importing namespaces, loading assemblies or registering new controls.
- Martha:** You're right Gloria. Freddy, could you help us explaining Code Section?
- Freddy:** I know that Code Section is the one that makes handlers and control events available in a page. For example, every time that a user clicks a button to request something, this is considered as an event that needs a coded answer from the event handler.
- Martha:** That's certainly true. Let's finish with Page Layout. What can you tell us about that Gloria?
- Gloria:** Well, it is directly linked to the interface. This section has different elements such as server controls, HTML tags, and inline JavaScript.
- Martha:** OK. I think you are all set. Let's start with the test! I will tell you later where to find more information about this topic in case you have any doubts.

Let's Practice!

I'll show you how to recognize the core sections in the following code snippet.

Instructions: Organize the mystery sentence. Read the sentences aloud. Check your pronunciation with your instructor.

1. do / Controls / what to / on / an / ASP.NET page. / show you

2. pages. / determining / Page Directives / are / process / in charge of / how to

3. make / explains / how to / control events / Code Section / handlers / available. / and

4. click on / Page Layout / users / the interface. / tells / where to

Let's Practice!

OK. I think you are all set. Let's start with the test!

Instructions: Select the correct answer.

1. ____ an environment ____ by Page Directives to make pages run?
 - a. Is - created
 - b. Do - create
 - c. Are - created
 - d. Does - create
2. ____ page processing ____ by different page-specific attributes?
 - a. Is - allowed
 - b. Do - allow
 - c. Are - allowed
 - d. Does - allow
3. Code Section shows you ____ handlers and control events available in a page.
 - a. where to make
 - b. when to make
 - c. what to make
 - d. how to make
4. ____ requests ____ as events in ASP.NET pages?
 - a. Is - considered
 - b. Do - consider
 - c. Are - considered
 - d. Does - consider
5. Page Layout shows ____ server controls or add HTML tags.
 - a. where to code
 - b. when to code
 - c. what to code
 - d. how to code

Extension Activity

Sections on ASP.NET Pages.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Find out more information about sections on ASP.NET pages.
- Identify the sections on a code snippet.
- Create a slider tutorial to explain each section on your code snippet.
- Prepare an oral presentation to present your slider tutorial.
- Share your work with the class.

Self-Assessment

Yes

No

- I find out more information about sections on ASP.NET pages.
- I identify the sections on a code snippet.
- I create a slider tutorial to explain each section on my code snippet.
- I prepare an oral presentation to present my slider tutorial.
- I share my work with the class.

☐ ☐
☐ ☐
☐ ☐

Target Words

- attribute** (noun): a particular condition that specifies the properties of an HTML element
e.g. This is done through different page-specific attributes that allow importing namespaces, loading assemblies or registering new controls.
- event handler** (noun): a sequence of code or routine used to solve a request
e.g. This is considered as an event that needs a coded answer from the event handler.
- interface** (noun): graphical resources that allow users to interact within a page or application
e.g. Well, it is directly linked to the interface.
- validation control** (noun): a mechanism to authenticate user input data
e.g. A page has different types; for example, HTML and Web server controls, validation controls and user controls.
- inheritance** (noun): a model in computing programming in which an object or class inherits the features of another
e.g. Are these controls run by inheritance?
- core** (adjective): essential or primary
e.g. I'll show you how to recognize the core sections in the following code snippet.

Learning Points

WH Word Clauses + Verb: How to, What to and Where to.

We can use clauses with a **WH word** and a verb when we are using verbs of thinking or saying such as *know, tell, suggest* or *ask*.

How to

We use **how to + verb** to emphasize on the manner in which an action is done. For example:

- *The page directives know **how to set up** the environment.*

What to

We use **what to + verb** when we are referring to the possible answer to a specific question. For example:

- *Programmer's tutorials always suggest **what to do** in case of having trouble when setting up controls.*

Where to

We use **where to + verb** to highlight the space where something can take place. For example:

- *The professor told us **where to** find interesting tutorials about ASP.NET.*

This is the structure that you generally use with **WH word clauses + verb**:

Subject + verb + **wh word + to + verb in base form** + complement.

Examples:

- *The code section shows **how to** provide handlers for the page control.*
- *You need to know **how to design** the page layout.*
- *He suggested us **what to do** to design our app.*

Examples

- *I'll show you how to recognize the core sections in the following code snippet.*
- *Each one of those sections is supposed to show you what to use as attributes.*
- *I will tell you later where to find more information about this topic in case you have any doubts.*

Learning Points

Simple Present Passive in Interrogative Form.

You use **simple present passive** in questions when you need to ask how things are supposed to be on a regular basis.

When we ask questions in active voice, we aim to highlight the person or element that performs an action:

- *Do **users** save ASP.NET pages with the .aspx extension?*

But when it comes to highlighting the role of the object in a sentence, we need to use the passive voice. We also used this tense in questions to confirm that something is done the way it is supposed to:

- *Are **ASP.NET pages** saved with the .aspx extension?*
- *Are **ASP.NET pages** with the .aspx extension saved by users?*

When using the passive voice the subject could be omitted, but in case you wish to mention it, you need to use the particle **by** followed by the noun.

This is the grammatical structure we need to use when building questions in **simple present passive**:

Verb be + Object + **Verb in past participle** + Complement?

Example:

- ***Are** page-specific attributes **specified** by directives in ASP.NET?*

Examples

- *Are ASP.NET pages made up of only controls?*
- *Are these controls run by inheritance?*
- *Is an ASP.NET page divided into core sections?*
