Let's Start!

Boxes and Buttons in ASP.NET.

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts. Describe applications for an operating system for personal computers in a range of work contexts.

Can Do Statements:

- I can talk about text box controls.
- I can exchange ideas about check boxes and radio buttons.
- I can describe list controls in ASP.NET.

Ask your partner:

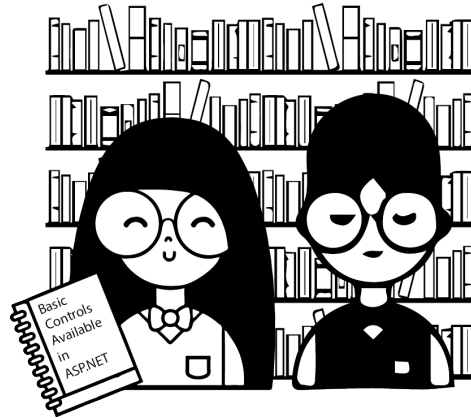

- What button controls do you think exist for ASP.NET?
- Why is the user's input important in ASP.NET? Share your ideas.

Let's Explore!

Mandy needs advice on how to get prepared for her exam.

Instructions: Read the text below.

Mandy: Please help me study for my test. It's about ASP.NET, I know you are an expert.

Nick: Sure. However, I don't know where to start. The topic of ASP.NET is very broad...

Mandy: It's about text box controls in ASP.NET.

Nick: Oh, that's easy! Text box controls are used to receive input from a user. Plus, they are designed to accept one or more lines of text, although that depends on the settings. All in all, text boxes are related to labels, and they are in charge of displaying the text.

Mandy: Now, I wonder what to include in the controls if the teacher asks me to list them.

Nick: Don't worry, some of them are TextMode, which includes a default type called SingleLine and another one called MultiLine. In MultiLine, the password masks the characters that are entered. Another example is Wrap, which determines if the text wraps a multi-line text box. You can also mention Columns, which determine the width of the text box in characters.

Mandy: I don't know what to focus on specifically for the exam.

Nick: You should probably put special attention to check boxes and radio buttons. They are linked to ASP.NET too. You need to know that there are check boxes that can be checked or unchecked, and that the radio buttons are those that show a group of options for the user to select.

Mandy: Got it! Now, I wonder how to memorize all the list controls in ASP.NET. Do you know any strategy I could use?

Nick: Of course, read and get involved with them. You have to remember that ASP.NET has control lists such as drop-down, list box, radio button, check box and bulleted. These lists allow users to select items from a series of options. Furthermore, they are loaded by using a code or a tool called ListItemCollection editor. I'll send you a document that contains some hyperlinks with that information.

Mandy: I wouldn't know what to do without you. Thank you!

Let's Practice!

An Experience Related to Text Box Controls.

Instructions: Read the paragraph. Underline all the questions within sentences.

I had to prepare my final exam. However, I realized that I had many unresolved questions about the topic of ASP.NET. I had to ask a partner about the specific topic that would be included in the exam and fortunately he told me that it was the text box controls. However, I still had some questions about that topic, so I called my best friend and left him a message: "I don't know where to start" and I asked for help. He was not at home and I didn't know what to do. Luckily, my brother came and he kindly explained to me that we use text box controls to receive the input from a user. Plus, he told me that we could change the settings of system to design these controls to accept one or more lines of text. I wonder how to review the other important aspects related to this topic.

Let's Practice!

Talking About List Controls in ASP.NET.

Instructions: Read the question. Select the correct answer.

1. What is probably the most important piece of information we get when we check list controls in ASP.NET?
 - a. Different list controls such as drop-down, list box, radio button, check box, and bulleted are perceived as really important ones.
 - b. In ASP.NET, checked and unchecked boxes are seen as some really important aspects.
2. What do we use these lists for?
 - a. These lists are used so users are able to select different items from various options.
 - b. These lists are used so users and administrators can access and modify information.
 - c. These lists are used by users to basically get profit from the information.
3. How do we load these list controls?
 - a. A series of different codes and commands are used to load them.
 - b. A series of technicians and hackers are hired to basically access the system and enter any needed information.
 - c. A code and a tool are used to load list controls.
4. What can you say about the tool we use to load information?
 - a. ListThisItemsCollectionLists is used as the default tool we use to load list controls.
 - b. ListItemCollection is used as an important code to load list controls.
 - c. LoadItemLists is used as an important code to load and download information.

Extension Activity

Is there anything else I can learn about this topic?

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about Basic Controls available in ASP.NET.
- Create a poster with other important information about Basic Controls available in ASP.NET that were not mentioned in this learning object.
- Share the poster you created with your partners.

Self-Assessment

Yes

No

- I look for more information about Basic Controls Available in ASP.net.
- I create a poster with the main characteristics of Basic Controls available in ASP.NET.
- I share my poster with my partners.

Target Words

- button** (noun): an area that generates an action after a user clicks on it
e.g. You should probably put special attention to check boxes and radio buttons.
- mask** (verb): to protect something
e.g. In MultiLine, the password masks the characters that are entered.
- uncheck** (verb): to remove a checkmark or not checking something
e.g. You need to know that there are check boxes that can be checked or unchecked and that the radio buttons are those that show a group of options for the user to select.
- hyperlink** (noun): also called 'link', refers to an access point for data or information
e.g. I'll send you a document that contains some hyperlinks with that information.
- wrap** (verb): to cover something
e.g. Another example is Wrap, which determines if the text wraps a multi-line text box.
- width** (noun): the size of something from one side to the other
e.g. You can also mention Columns, which determine the width of the text box in characters.

Learning Points

Questions Within Sentences.

We use **questions within sentences** to introduce a question in a statement; in other words, we use it to implicitly enquire about something, as we are not asking a direct question.

When we talk about **questions within sentences**, we talk about statements that are mostly used in conversations. In fact, as we are making an indirect question that is included in a sentence, we do not have to use a question mark at all. Now, these questions have an introductory clause such as:

I wonder...

I don't know...

I want to know...

After the introductory clause we have a dependent clause; in this case, we present the question, which can be, for example, **what to + verb**. Check the following examples:

*I don't know **what to do** to understand this topic. I find technology so confusing.*

*She wanted to know **what to prepare** for next class.*

*They are wondering about **what to include** in the next project.*

Examples

- *Now, I wonder what to include in the controls if the teacher asks me to list them.*
- *I don't know what to focus on specifically for the exam.*

Learning Points

Common Properties of the Button Control

ASP.NET includes some **properties** that allow a better functionality.

There are some **properties** of the button control in ASP.NET that you have to be familiar with. Check the following chart to learn about them:

PROPERTIES	DESCRIPTION
Text	This property is for the text displayed on the button.
ImageUrl	This property includes the image that shows on the button.
AlternateText	If the browser cannot display the image, it would show an alternative text.
CausesValidation	Checks if the page validation takes place after a user click on the button.
CommandName	A string value send to the command event.
CommandArgument	A string value send to the command event.
PostBackUrl	Shows the URL requested after the button has been clicked on.
