Let's Start!

How Directives Work in ASP.NET

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts. Describe applications for an operating system for personal computers in a range of work contexts.

Can Do Statements:

- I can say what directives are in ASP.NET.
- I can list some of the directives in ASP.NET.
- I can talk about characteristics of some directives in ASP.NET.

Ask your partner:

- How do you provide instructions when creating a webpage?
- Which are some basic controls in ASP.NET? Give examples.

Let's Explore!

Laura needs to review everything about directives in ASP. NET

Instructions: Read the text below.

David: What's the matter, Laura? You look stressed.

Laura: I'm really nervous. I'm applying for a position in a software development company, and I have an admission test tomorrow.

David: I see. Is there anything I can help you with?

Laura: Yes. I need to review some aspects about ASP.NET directives. Could you give me a hand with that?

David: Sure. Actually, I had to write a paper about that for my computer programming class.

Laura: Perfect! How would you define the ASP.NET directives?

David: We can say that ASP.NET directives are commands that programmers use to add optional settings to a website; for instance, you use them for registering a custom control or for specifying page language.

Laura: OK. So, if I understand you correctly, you are saying that these settings can define the way in which web forms or user controls are run by the .Net framework. Right?

David: Exactly. That is the reason why there are different kinds of directives. For example, there is a type called Application Directive, it is used to specify application specific-attributes such as Inherits, Description and Language.

Laura: Right. I remember. There is also an Assembly Directive. When you use it, you can connect an assembly to a page or application when parsing, and you need to use Name and Source attributes.

David: Well-done! Let's continue with the Control Directive. It is necessary to manage the user controls in the .Net framework before programming a setting with this directive. There are plenty of attributes for the Control directive, for example, ClassName, Debug, Explicit or Strict.

Laura: Thanks. I guess some types are missing.

David: Yes, we have also Implements, Import, and Master Directives. If you set the Implement Directive, you point out that your page needs to use a specific interface. In the case of the Import one, it can introduce a namespace into a page or application.

Laura: I see. I guess the Master Directive is the one we use for defining a page as the master one.

David: You're right. I think you are going to do pretty well at the test; you remember things easily.

Let's Practice!

How would you define the ASP.NET directives?

Instructions: Proofread the sentences. Correct the mistakes.

1. You can program ASP.NET directives for add optional settings to a website.
2. ASP.NET directives can be used for registered a custom control or for specifying page language.
3. By set ASP.NET directives, it is possible to define the way in which web forms or user controls are run by the .Net framework.

Let's Practice!

David is helping Laura to do some revisions.

Instructions: Select the correct answer in order to complete the sentence.

1. If I _____ to add optional settings to a website, I _____ to add ASP.NET directives. (Hint: Simple present for first person singular)
 - a. want – need
 - b. wants – needs
 - c. wanted – needed
 - d. wanting - needing
2. For example, when a programmer _____ a custom control, it _____ to use a Control Directive. (Hint: Simple present for third person singular)
 - a. register – requires
 - b. registers – requires
 - c. registered - required
 - d. registering - requiring
3. If you _____ the Implement Directive, you _____ that your page needs to use a specific interface. (Hint: organize and emphasize)
 - a. take – require
 - b. program - deny
 - c. set - point out
 - d. study - estimate

Extension Activity

Creating a Slider Tutorial on ASP.NET Directives

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about ASP.NET directives.
- Identify key information about each type of directive and take notes.
- Create a slider tutorial to explain each type of directive, its use and attributes.
- Prepare an oral presentation to present your slider tutorial.
- Share your slider tutorial with the class.

Self-Assessment

- | | Yes | No |
|--|-----------------------|-----------------------|
| 1. I deepen my knowledge about ASP.NET directives. | ☐ | ☐ |
| 2. I recognize important information from a text. | ☐ | ☐ |
| 3. I express information through a tutorial. | ☐ | ☐ |
| 4. I orally share information to my classmates. | ☐ | ☐ |

Target Words

- **custom** (adjective): made with a particular purpose
e.g. You use them for registering a custom control or for specifying page language.
- **attribute** (noun): a particular characteristic to set the properties of objects, elements or files in computing
e.g. For example, there is a type called Application Directive. It is used to specify application specific-attributes such as Inherits, Description and Language.
- **directive** (noun): an order or direction
e.g. We can say that ASP.NET directives are commands that programmers use to add optional settings to a website.
- **parse** (verb): to analyze data by putting it into smaller chunks to be easily manipulated
e.g. When you use it, you can connect an assembly to a page or application when parsing.
- **point out** (phrasal verb): to indicate something specifically
e.g. If you set an Implement Directive, you point out that your page needs to use a specific interface.
- **namespace** (noun): a group of symbols to organize files, variables or resources
e.g. In the case of the Import one, it can introduce a namespace into a page or application.

Learning Points

Zero Conditional Review

You use the **present conditional** or **zero conditional** to express general truths or facts that can always be possible.

When you use this conditional, it is necessary to use two clauses in present simple: the conditional clause and the result clause.

For example:

- **If** you **need** to add extra settings to a webpage, you **can use** directives in ASP.NET
- You **can use** directives in ASP.NET **if** you **need to** add extra settings to a webpage.

Notice that when the conditional clause goes at the beginning, you must add a comma before the result clause.

These are the structures when using the **zero conditional**:

If/When Clause in Simple Present (Condition)
+ Simple Present (Result)

Simple Present (Result) + **if/when** clause
+ Simple Present (Condition)

The word **if** can be replaced by **when** without changing the condition meaning:

- **If** he wants to describe how the controls are processed, he has to program directives.
- **When** he wants to describe how the controls are processed, he has to program directives.

Examples

- So, if I understand you correctly, you are saying that these settings can define the way in which web forms or user controls are run by the .Net framework.
- When you use it, you can connect an assembly to a page or application when parsing, and you need to use Name and Source attributes.

Learning Points

Gerunds After Prepositions

Every time that there is a verb after a preposition, the verb has to take the **gerund or verb + ING** form.

A **gerund** represents a noun-phrase in a sentence and it can always be replaced by an actual noun.

These are some examples on how using gerunds or names after prepositions:

For

- We use directives **for adding** extra settings in web pages or applications.
- We use directives **for the addition** of extra settings in web pages or applications.

After

- **After setting** directives, you can register custom controls.
- **After the setting** of directives, you can register custom controls.

Before

- **Before taking** the test on ASP.NET directives, you need to review all types.
- **Before the examination** on ASP.NET directives, you need to review all types.

Examples

- For instance, you use them for registering a custom control or for specifying page language.
- It is necessary to manage the user controls in the .Net framework before programming a setting with this directive.
